

SDS PLUS STEELS

A range of five of the most popular steels, selected for their suitability for most applications when working on concrete, bricks marble and hard stone.

Made from drop forged chrome molybdenum with heat treated tempered edges and points.

Molybdenum is ideally suited for points and steels because of its known reputation for hardness, toughness and wear resistance.

NB. The SDS machine must have a "roto stop" function for use with these chisels. This switches off the rotary action to leave just a hammer facility allowing the drill to be used as a breaker or demolition hammer with a suitable chisel bit.

Chisel Point

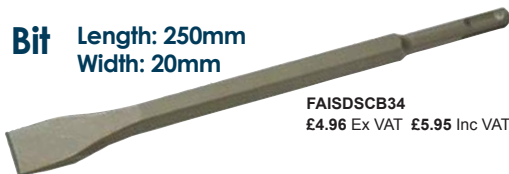

Length: 250mm
