Mitre Box - Skirting

This tunnel form box will accept wide boards up to 25mm thick to be clamped for cutting accurate mitres. Saw guidance is against hard wearing faces with integral clamping by thumb screws. The step feature allows the box to be steadied against a stop or to be clamped in a vice. Designed to cut external or internal mitres from the front face of the moulding up to a depth of 230mm.

Bench Hook

A woodworking accessory that enables a piece of wood to be held firmly in position while it is cut. It acts simply as a support for the piece of wood currently being worked on. By keeping the work piece firmly in place, a bench hook can help prevent errors, improve precision and increase safety. It 'hooks' to the surface with one of its two battens while the work piece 'hooks' against the other batten. It is the forward pressure of the woodworker's hand on the work piece and the forward cutting action of the tools used to work the wood that hold the bench hook in place.
