## CAUTION PRIOR TO USE

To avoid possible damage to the meter or to the equipment under test, follow these guidelines.  
 Disconnect circuit power and discharge all capacitors before carrying out a resistance, diode or continuity test.  
 Use the proper terminals and function for your measurement.

Before measuring current, check the meter's fuse and turn off the power to the circuit before connecting the meter to the circuit.

Before turning the rotary switch to change functions, disconnect test leads from the circuit under test.

## NOTE:

When making connections, connect the Black test lead before you connect the Red test lead. When you disconnect test leads, disconnect the Red test lead first.

### Data Hold Mode

Press the " HOLD " button to enter Data Hold mode. The present reading is held on the display and the " H " symbol appears on the display as an indication.

To exit Data Hold mode, just press this button again. The " H " symbol disappears.

### MIN MAX RECORDING MODE

The MIN MAX recording mode stores the minimum and maximum input values. When the input goes below the stored minimum value or above the stored maximum value, the meter stores the new value.

#### Using the MIN MAX recording mode:

1. Ensure the meter is set for the correct function.
2. Press the "MAX/MIN" button sequentially to switch between the MIN or MAX recording mode.
3. MAX Mode the display shows the maximum reading of all the readings taken since the meter entered this mode, and " MAX " is shown on the display as an indication.
4. MIN Mode the display shows the minimum reading of all the readings taken since the meter entered this mode, and " MIN " is shown on the display as an indication.
5. To exit the " MAX/MIN " recording mode and erase all stored readings, press and hold down the " MAX/MIN " button for approximately two seconds and the meter will return to its normal operation.

**NOTE:** The meter will exit the Autorange mode automatically when the " MAX/MIN " button is pressed and will remain in the selected manual range mode until the " MAX/MIN " mode is cancelled. To cancel the " MAX/MIN " function hold down the " MAX/MIN " button for two seconds or rotate selector switch, the meter will then return to the Autorange mode. When the display shows " OL " it indicates overrange reading.

## MEASURING DC VOLTAGE

1. Insert the plug of the Black test lead to the " COM " jack socket and the plug of the Red test lead into the " INPUT " jack socket.
2. Set the rotary switch to "  $\overline{V}$  " position.
3. Connect the test leads across the source or circuit to be tested.
4. Read the voltage value on the LCD display. The polarity of the Red test lead connection will be indicated as well.

## MAINTENANCE

### Warning

Except replacing fuse and battery, never attempt to repair or service the meter.

Store the meter in a dry place when not in use. Don't store it in an environment with intense electromagnetic field.

### General Maintenance

Periodically wipe the case with a damp cloth and a little mild detergent. Do not use abrasives or solvents.

Dirt or moisture in the terminals can affect readings.

Clean the terminals as follows:

1. Turn off the meter and remove all the test leads from the meter.
2. Shake out any dirt which may exist in the terminals.
3. Soak a new swab with alcohol.
4. Work the swab around in each terminal.

If the meter does not seem to work properly, check and replace ( as needed ) the batteries or fuse; and/or review this manual to verify correct operation.

### Caution

**To avoid possible damage to the meter or to the equipment under test, follow these guidelines:**

- Disconnect circuit power and discharge all capacitors thoroughly before testing resistance or continuity.
- Use the proper terminals and function for your measurements.
- Before measuring current, check the meter's fuse and turn off power to the circuit before connecting the meter to the circuit.
- Before turning the rotary switch to change function, remove the test leads from the circuit under test.

## BATTERY REPLACEMENT

When the symbol "  " appears on the LCD display, the batteries are low and should be replaced immediately. Remove the screw on the battery cover and slide the cover to the right. Replace the exhausted batteries with new ones of the same type ( 2 x 1.5V AAA or equivalent) ensure the polarity connections are correct as indicated in the battery compartment. Reinstall the back cover and replace the screw

## FUSE REPLACEMENT

To replace a blown fuse, remove all the screws on the back including the battery compartment cover and remove the complete back cover. Replace the blown fuse with a new one of the same ratings. Reinstall the back cover and all the screws. The meter uses one fuse: 12N600V, Fast action, Min. Interrupt Rating 10kA, 6.35X32mm

### WARNING

**To avoid possible electric shock or personal injury, follow these guidelines:**

- Do not use the meter if it is damaged. Before you use the meter, inspect the case. Pay particular attention to the insulation surrounding the connectors.
- Inspect the test leads for damaged insulation or exposed metal. Check the test leads for continuity. Replace damaged test leads before you use the meter.
- Do not use the meter if it operates abnormally. Protection may be impaired. When in doubt, have the meter serviced.
- Do not operate the meter around explosive gas, vapor, or dust.
- Do not apply more than the rated voltage, as marked on the meter, between terminals or between any terminal and earth ground.
- Before use, verify the meter's operation by measuring a known voltage.
- When measuring current, turn off circuit power before connecting the meter in the circuit. Remember to place the meter in series with the circuit.
- When servicing the meter, use only specified replacement parts.
- Use caution when working with voltage above 30V ac rms, 42V peak, or 60V dc. Such voltages pose a shock hazard.
- When using the probes, keep your fingers behind the finger guards on the probes.
- When making connections, connect the common test lead before you connect the live test lead. When you disconnect test leads, disconnect the live test lead first.
- Remove the test leads from the meter before you open the battery cover or the case.
- Do not operate the meter with the battery cover or portions of the case removed or loosened.
- To avoid false readings, which could lead to possible electric shock or personal injury, replace the batteries as soon as the low battery indicator (  ) appears.
- To avoid electric shock, do not touch any conductor with hand or skin; and do not ground yourself while using this meter.
- When in Data Hold mode, the symbol "  " is displayed. Caution must be used because hazardous voltage may be present.
- Do not use the meter in a manner not specified by the manufacturer or the safety features provided by the meter may be impaired.

- Adhere to local and national safety codes. Individual protective equipment must be used to prevent shock and arc blast injury where hazardous live conductors are exposed.
- Do not use the meter if the meter, a test lead or your hand is wet.
- For measurements on main or within Measurement Category III / IV circuits, the attached test probes must be set in Measurement Category III / IV mode; otherwise electric shock may occur!
- Remaining endangerment:  
When an input terminal is connected to dangerous live potential it is to be noted that this potential can occur at all other terminals.
- **CAT III** - Measurement Category III is for measurements performed in the building installation. Examples are measurements on distribution boards, circuit breakers, wiring, including cables, bus-bars, junction boxes, switches, socket-outlets in the fixed installation, and equipment for industrial use and some other equipment, for example, stationary motors with permanent connection to the fixed installation.  
Do not use the meter for measurements within Measurement Category IV.
